

## Claims

1. A communications device wall mounting adapter and jack conversion unit comprising: (a) base plate having at least 1 rectangular hole therein; (b) plate having extended walls integrally connected thereto and extending vertically from and around its periphery thus creating a cavity on the back side of the plate. (c) at least two screw or nail head type studs each having a shank portion being in connection with the plate and the screw or nail head like portion extending above the plate. (d) a plurality of horizontal and parallel slots and holes which can accept various fastening devices; a flat portion on the back which can accept double-sided tape or other means of fastening to an existing flush wall jack or fastening as a stand alone unit.
